Firstly what we asked was

- Digital health records (longitudinal patient history)
- Lab + pharmacy integration
- Referral system (GP → specialist)
- LMS + patient education
- Clinical audit + QA
- Gamification & lifestyle tracking

But what you gave is very basic focuses mainly on:

- booking
- video consult
- basic prescription

That's **only 30–40% of your vision**

We clearly asked for advanced ecosystem requirements like:

- "Quality assurance parameters / Clinical Audit"
- "Doctors LMS / Patient educational"
- "Discussion forums"
- "Gamification & analytics"

A real virtual hospital must include:

- Structured consultation flow (history → exam → diagnosis → plan)
- Referral pathways
- Clinical documentation standards

We required:

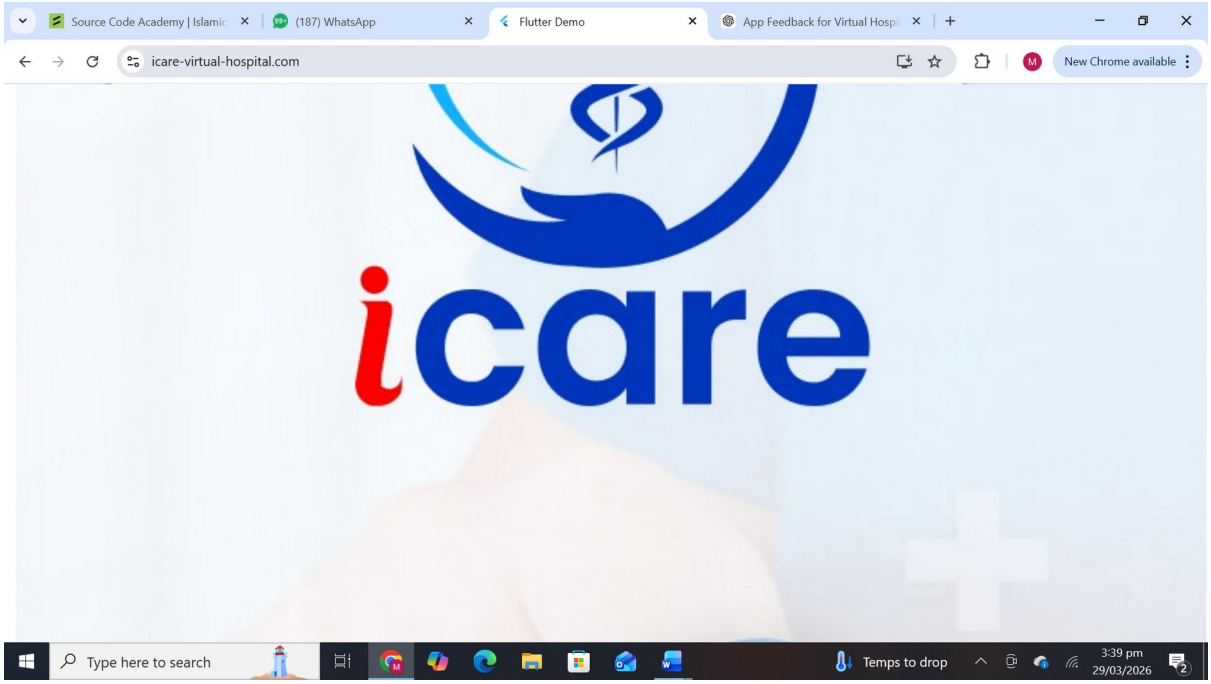
- Clinical audit
- Revenue analytics
- System usage reports
- QA monitoring

And you gave us give:
❌ simple dashboards
❌ no real healthcare analytics

And what about:

- Subscription plans
- Tiered services
- Chronic care programs
- Preventive health packages

Where these will go?



WHEN WE OPEN WEBSITE ICARE LOGOAPPEARS ZOOME OUT

"The login screen needs to establish trust and clearly communicate that this is a healthcare platform. Currently, it feels like a generic system interface. Please add healthcare-specific messaging, such as a tagline and trust indicators (secure data, verified doctors).

The 'Switch Role / Testing Bypass' option should be removed from the user interface and handled internally or during signup. Role selection should be user-friendly and invisible during login.

Additionally, improve visual balance by reducing logo size and adding meaningful content such as key platform benefits. Enhance emotional design by using healthcare-relevant visuals and softer, reassuring design elements.

Finally, include better microcopy and guidance for users during login and error handling."

1= Add under logo:

"Your Virtual Healthcare Platform"
"Secure consultations, prescriptions & health records"

Also add:

- "Secure & HIPAA-compliant" (or at least "Data Protected")
- "Verified Doctors"

2.You wrote: "Switch Role / Testing Bypass" **Replace with:**

During signup:

- "I am a Patient"
- "I am a Doctor"

After login:

- System automatically routes

No "role switching" visible publicly

3. VISUAL BALANCE ISSUE, Left side too heavy (huge logo) while Right side form looks compressed ,please Reduce logo size and Add meaningful content on left:

LEFT SIDE:

- Logo
- Tagline
- 3 benefits: (optional)
    - Book doctors online
    - Get prescriptions

- Access lab reports

4. WEAK EMOTIONAL CONNECTION: it Feels like generic software login , Add:

- Soft background (doctor/patient interaction)
- Or subtle healthcare illustration

5. Under login button:

- "Access your health dashboard securely"

6. SOCIAL LOGIN: Google / Facebook shown without context please Add label: "Quick Sign In"

7. NO ERROR: You must ensure:

When user:

- enters wrong password
- forgets email

System should:

- clearly guide
- not frustrate

we want user friendly ideal login experience like

User opens app → Immediately understands:

- This is a healthcare system
- It is safe
- It is easy

LOGIN ROLE SCREEN :

"The role selection screen needs simplification and better alignment with user experience. Currently, too many roles are presented, which can confuse users and reduce engagement. Only 'Patient' and 'Doctor' should be visible at the initial stage, while other roles (lab technician, pharmacist, instructor, student) should be managed internally or through admin workflows.

The messaging under each role should be more benefit-driven and clearly explain what the user can do within the platform. Additionally, the UI should guide users by highlighting the primary role (Patient) and improving visual hierarchy.

The statement ‘Account type cannot be changed later’ creates unnecessary friction and should be removed or softened.

Finally, this screen should only appear during onboarding for new users, not for returning users, and should clearly communicate trust, security, and healthcare relevance.”

REMEMBER THIS : Not all users are equal and Not all users should enter the system the same way our login screen should feel like “I’m entering a hospital system” NOT “I’m logging into software”

Split roles into 2 layers:

Step 1 (Public-facing):

Show ONLY:

- Patient
- Doctor

Step 2 (Inside system / admin-controlled):

- Lab Technician
- Pharmacist
- Instructor
- Student

These should NOT be shown to general users

✓ Make it **benefit-driven + specific**

Example:

Patient:
👉 “Consult doctors, access prescriptions & manage your health”

Doctor:
👉 “Manage patients, consultations & digital prescriptions”

NO TRUST BUILDING

For healthcare, first screen must say:

👉 “You are safe here”

Add:

- 🔒 Secure platform
- ✔️ Verified professionals
- 📊 Trusted healthcare system

"ACCOUNT TYPE CANNOT BE CHANGED" Change to: "Your role helps personalize your experience" OR remove completely and **CONTINUE BUTTON** remove with"Select a role to continue"

- ✓ Right now Feels like system selection while should feel like "Welcome to your healthcare journey"

IDEAL FLOW

Current Flow:

Login → Role selection → Dashboard

While it should be something like this :

- ✓ First-time user only Select role while Returning user Skip this screen completely

Example:

- **If Patient selected:**
  → Health dashboard
  → Consult doctor
  → LMS = "Health Programs"
- **If Doctor selected:**
- → Clinical dashboard
  → Patient management
  → LMS = "Professional training"
- SAME SYSTEM
- DIFFERENT EXPERIENCE

OUR SYSTEM HAS 2 TYPES OF USERS

1. PUBLIC USERS (Self-signup)

These are people who come to your platform directly:

- Patient
- Doctor (optional self-apply)

These should:

- Sign up themselves
- Choose role
- Enter system directly but require approval

2. CONTROLLED USERS (Admin-managed)

These are **system partners**, NOT random users:

- Lab Technician
- Pharmacy
- Instructor (LMS teachers)
- students

These should NOT freely sign up

CORRECT SYSTEM DESIGN (VERY IMPORTANT)

ADMIN CREATES THESE USERS

For Labs:

Admin:

- Registers lab
- Adds:
    - Name
    - Location
    - License
    - Contact

Then system generates:

- Login ID
- Password

For Pharmacy:

Same process:

- Verified onboarding

- Admin approval

For Instructor and student same

LOGIN FLOW FOR THEM

They DO NOT go through “Patient/Doctor selection”

Instead:

Same login page
System detects role automatically

HOW THEY USE SYSTEM

LAB FLOW

- Receives test request from doctor
- Accepts/rejects
- Uploads report
- Sends to patient

PHARMACY FLOW

- Receives prescription
- Confirms availability
- Manages delivery
- Updates status

INSTRUCTOR FLOW

- Creates courses
- Assigns to patients/doctors
- Tracks progress

HOW THIS CONNECTS TO PATIENT

Example:

1. Doctor prescribes:

- Lab test

- Medicine
- Learning program

2. System automatically sends:

- Lab request → Lab dashboard
- Prescription → Pharmacy
- Course → LMS

3. Patient sees everything in ONE place:

- My Tests
- My Medicines
- My Learning

This is what we have been

“Roles such as Lab Technician, Pharmacy, and Instructor should not be available for public signup. These roles must be created and managed through the admin panel with proper verification and onboarding processes.

The system should support role-based access where users log in through a single interface, and the system automatically routes them to their respective dashboards based on assigned roles.

Patients and doctors can register through the application, but labs, pharmacies, and instructors must be controlled entities to ensure system reliability, quality, and compliance.”

Think of our system like a **real hospital**:

- Patients walk in
- Doctors apply / are approved
- Labs & pharmacy are **authorized partners**

ROLE AS STUDENT :

“The LMS should not function as a standalone academic module. It must be integrated into the clinical workflow. Patients should see it as ‘Health Programs’

or ‘Care Plans’ assigned by doctors, not generic courses. The interface must be role-based, showing different experiences for patients and professionals. Additionally, courses should be linked to diagnoses, prescriptions, and follow-ups to ensure continuity of care.”

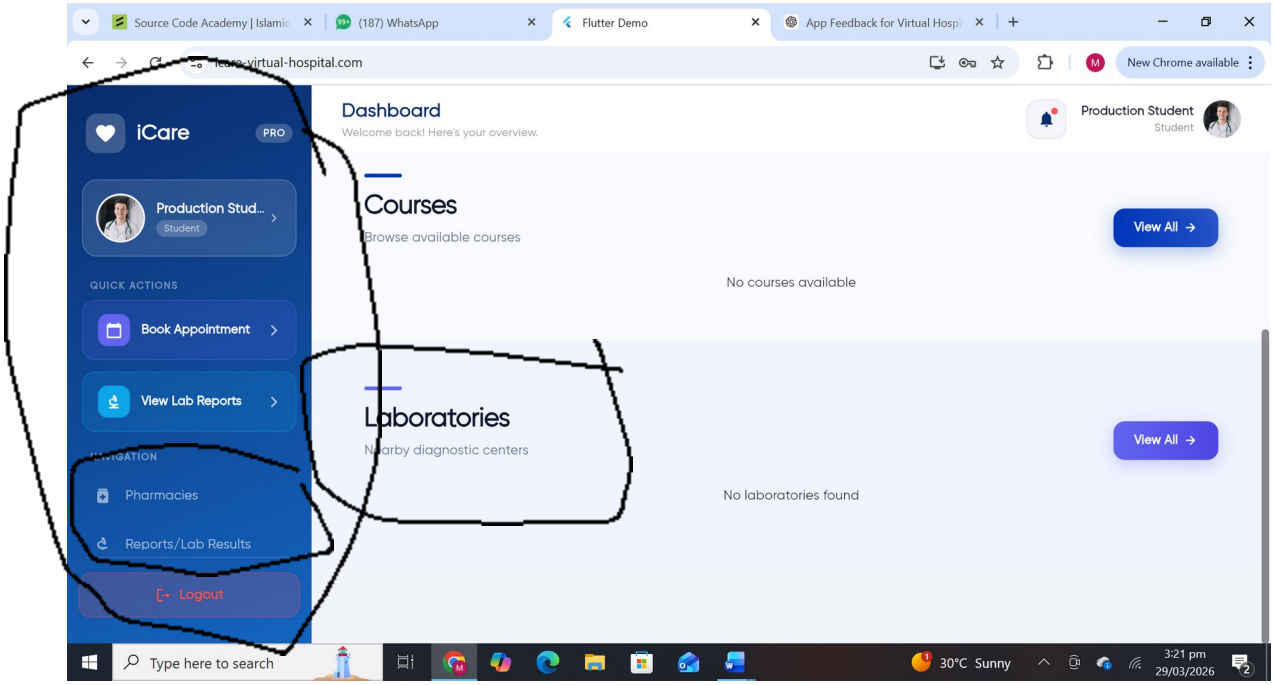


Figure 1Y LABORTARIES IN LMS? Y NAVIGATION SHOWING LABS PHARMACIES AND EXTRA IN LMS

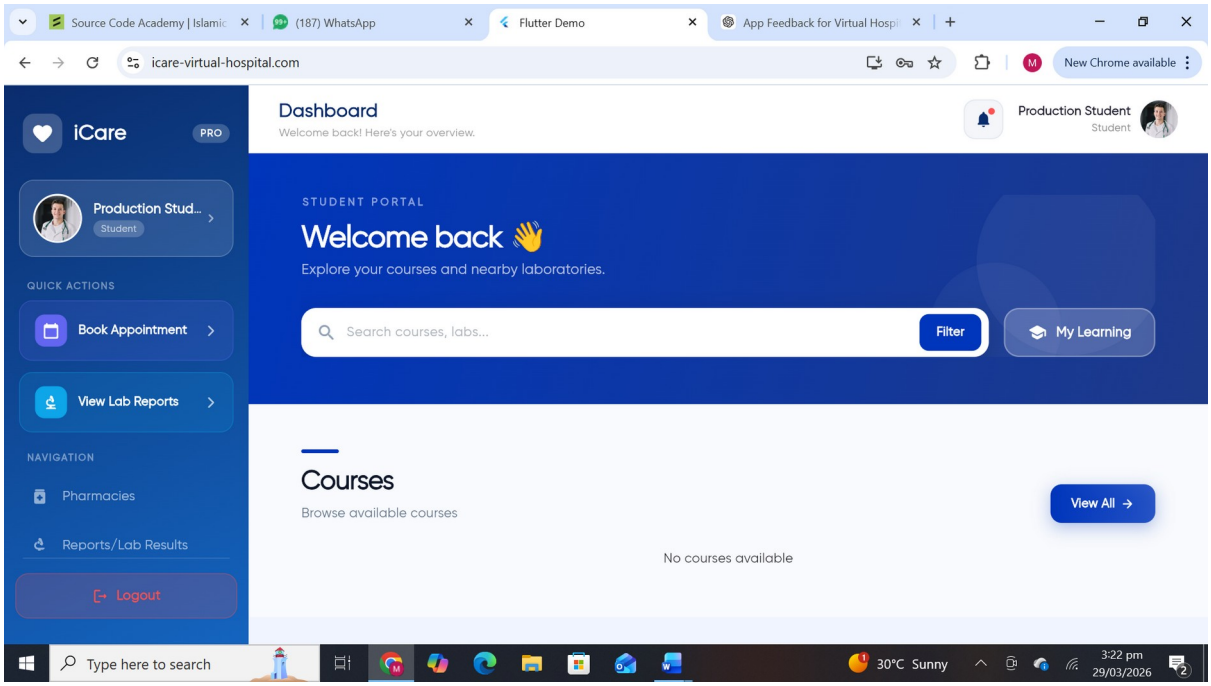

Figure 2 Y DASHBOARD MENTION LABORATRIES NEARBY UNDERWELCOME AS ITS LMS?

1. DASHBOARD (Student View)

Even if LMS is valid, Why does a **patient see "Student Portal"?**

This creates:

- Identity confusion
- Trust issues
- Cognitive overload

we need **ROLE-BASED EXPERIENCE**

✔️ **If user = Patient:**

- Hide LMS language
- Show:
    - "Health Programs"
    - "Your Care Plan"

✔️ **If user = Doctor / Student:**

- Show LMS (courses, certificates)

✓ SAME SYSTEM
✓ DIFFERENT UX

2. COURSES PAGE → Rename & Reposition

Current:

- "Find your next course"
- Academic tone

Change to:

For Patients:
"Health Programs"

Examples:

- Diabetes Management Program
- Weight Loss Plan
- Prenatal Care

For Doctors:
Keep:

- Courses
- Certifications

3. MY LEARNING → TRANSFORM

Current:

- Empty courses
- Certificates

For Patients:

Rename to:
“My Health Journey”

Show:

- Assigned programs
- Progress
- Doctor recommendations

For Professionals:

Keep:

- My Courses
- Certificates

Integration Model

1. Doctor → LMS Connection

During consultation:

Doctor should be able to:

- Assign course/program to patient

Example:

- “Hypertension Control Program”
- “Post-surgery rehabilitation”

2. Patient Dashboard Integration

After consultation:

Automatically show:

- "Your Care Plan"
- "Recommended Learning"

3. Smart Linking

Inside LMS:

Every course should connect to:

- Condition
- Treatment plan
- Follow-up

REAL USER FLOW

✓ Patient books consultation
→ Doctor diagnoses diabetes
→ System (DOCTOR) does:

- Adds medication
- Recommends lab tests
- Assigns "Diabetes Care Program"
- Schedules follow-up

✓ Patient sees:

- My Medications
- My Reports
- My Learning

Right now LMS Feels like Separate app It should feel like**Part of treatment/app** NOT "extra feature"

When doctor prescribes:

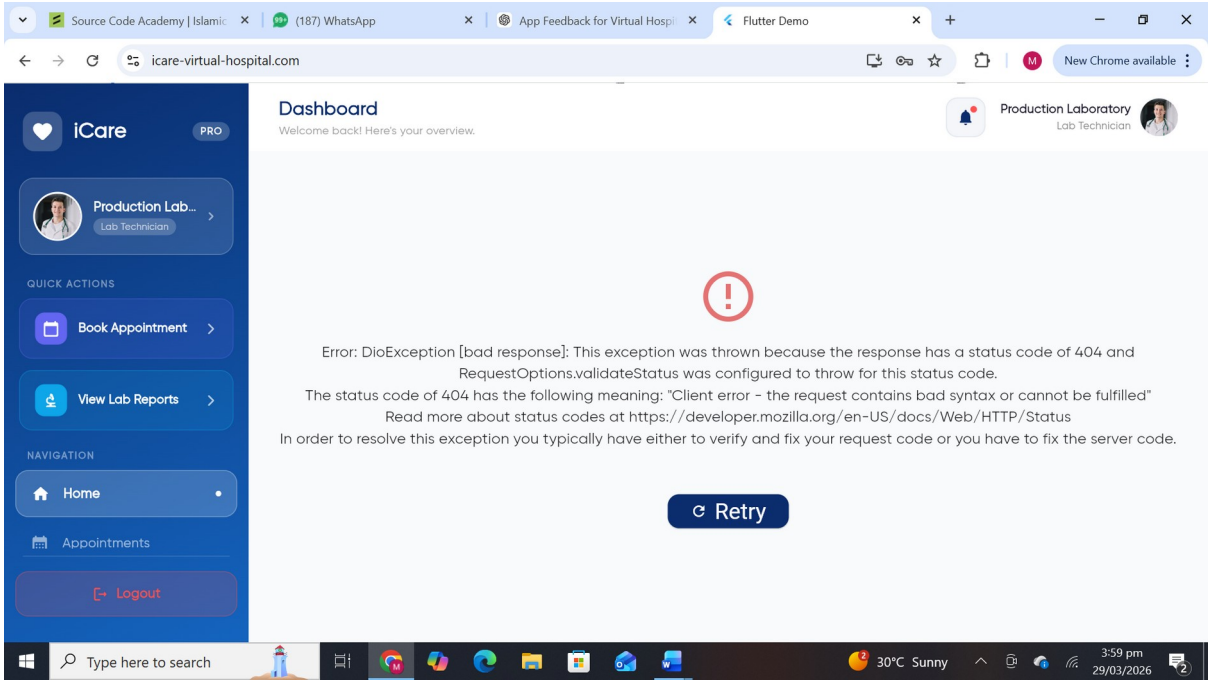
Instead of only:

- Medicine

Add:

- Medicine
- Lab
- Learning module

LOGGED INTO INSTRUCTOR ACCOUNT THIS HAPPENED



Y EVERY DASHBOARD ROLE IS SAME? Y BOOK APPOINTMENT

LAB DASHBOARD

1. CRITICAL ERROR You're showing:

DioException / 404 / developer message

What it SHOULD show instead:

Clean error state:

- "Unable to load test requests right now"
- "Please try again"

Buttons:

- Retry

- Contact support

“Never expose backend errors to end users”

2. WRONG DASHBOARD STRUCTURE

Current:

- Book Appointment
- View Lab Reports

Lab users don’t:

- book appointments
- browse reports

They **PROCESS requests**

CORRECT LAB DASHBOARD

Lab Role = “Service Provider”

They should:

1. Receive test requests
2. Process tests
3. Upload reports

our dashboard MUST show:

TOP SECTION:

- Pending Requests
- In Progress
- Completed

MAIN TABLE:

Each request should show:

- Patient Name
- Doctor Name
- Test Type

- Date
- Status
- Action button

ACTION BUTTONS:

- Accept Request
- Mark as Completed
- Upload Report

3. MISSING CORE FEATURE

There is NO visible:

- Incoming requests
- Workflow
- Actions

We NEED:

"Incoming Test Requests" module

HOW LAB CONNECTS TO OUR SYSTEM

This is the **heart of your virtual hospital**

Real Workflow:

Step 1: Doctor: Orders lab test

Step 2: System: Sends request to Lab dashboard

Step 3: Lab:

- Accepts request
- Performs test
- Uploads report

Step 4: Patient: Sees report instantly

THIS is what our system must do

4. SIDEBAR UX IS WRONG

Replace with:

For LAB:

- Dashboard
- Test Requests
- Upload Reports
- History
- Profile

5. NO PRIORITY / URGENCY HANDLING

In healthcare: Not all tests are equal

Add:

- Urgent cases (highlighted)
- Normal cases
- Completed

6. NO PATIENT CONTEXT

Lab must know:

- Who is patient
- Who is doctor
- Why test is ordered

Add:

- Diagnosis note
- Doctor instructions

"The current lab dashboard is not aligned with the actual workflow required for lab users and appears to be a reused patient interface. Critical functionality such as incoming test requests, status management, and report uploads is missing.

Additionally, the system is currently displaying raw technical error messages (e.g., DioException 404), which is not acceptable for end users and must be replaced with user-friendly error handling.

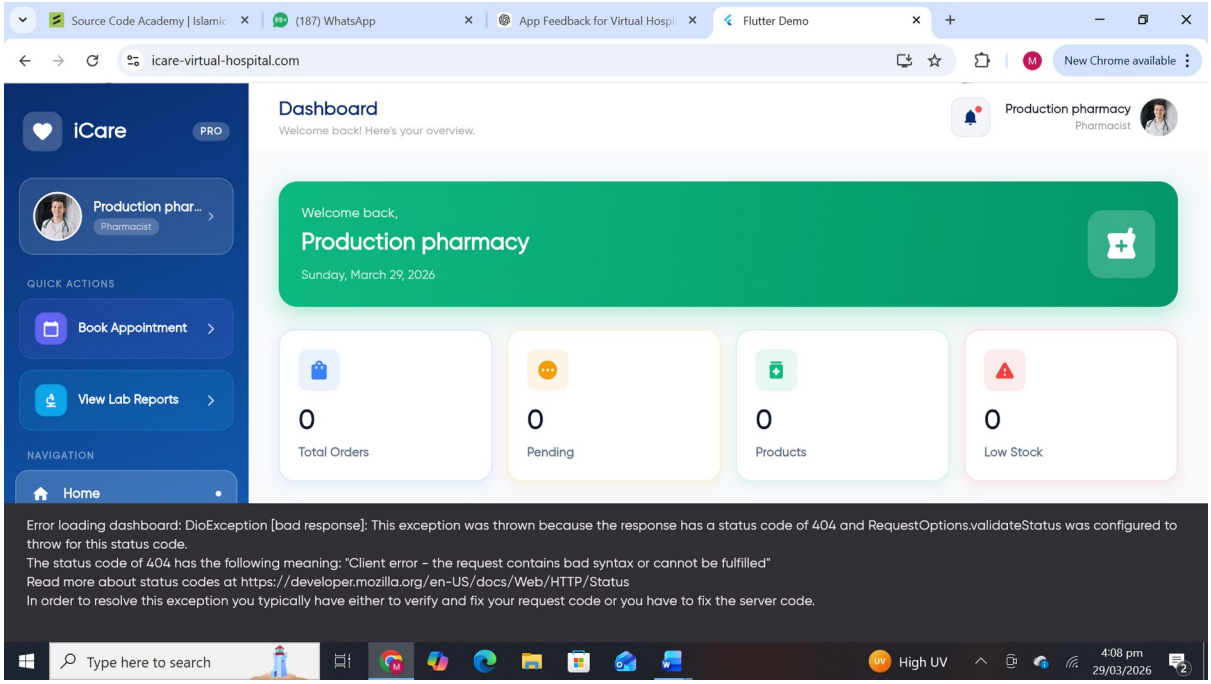
The lab interface should be redesigned to focus on its core workflow: receiving test requests from doctors, processing those requests, uploading reports, and tracking status.

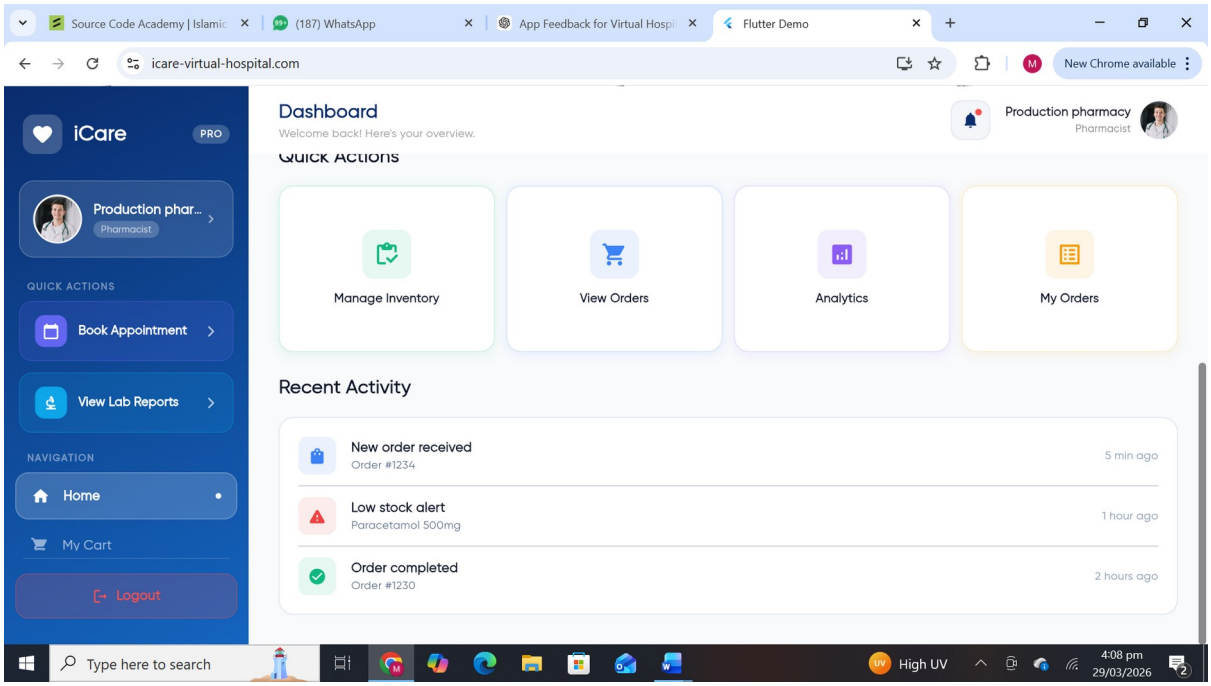
The navigation menu should also be role-specific, replacing irrelevant options such as 'Book Appointment' with 'Test Requests,' 'Upload Reports,' and 'History.'

This module is a core part of the virtual hospital system and must be designed as a functional service workflow, not as a static dashboard."

Right now our system Looks like multiple disconnected apps we need ONE SYSTEM with
DIFFERENT ROLE EXPERIENCES

ROLE AS PHARMACY





This screen MUST be **Pharmacy Partner Dashboard (B2B side)** NOT patient-facing

1. DASHBOARD

Issues:

- "Book Appointment" → irrelevant
- "View Lab Reports" → irrelevant
- "My Cart" → patient feature

- “Inventory + Orders” → pharmacy feature

This is a **mixed UI**

2. ERROR MESSAGES

3. INVENTORY SCREEN

- Categories (Pain Relief, Antibiotics etc.)
- Search bar
- “Add Product” button
- Sample placeholder
- Bulk upload option

4. ORDERS SCREEN

Should show:

Each order:

- Patient name
- Prescription
- Medicines
- Status

Buttons:

- Accept
- Reject
- Mark as delivered

5. ANALYTICS SCREEN

Should show:

- Orders per day
- Revenue
- Top medicines

6. “MY CART” Pharmacy should NOT have cart

our system is built as Feature-based, UI reused across roles. It NEEDS to be Role-based and Workflow-driven

CORRECT PHARMACY SYSTEM

Pharmacy Role = "Order Fulfillment System"

NOT shopping
NOT browsing

IDEAL PHARMACY DASHBOARD

TOP:

- New Orders
- Pending
- Completed
- Low Stock

MAIN SECTION:

"Incoming Prescriptions"

Each row:

- Patient
- Doctor
- Medicine list
- Status

ACTIONS:

- Accept Order
- Prepare Medicines
- Dispatch
- Mark Delivered

HOW IT CONNECTS TO OUR SYSTEM

REAL FLOW:

Step 1: Doctor: Prescribes medicine

Step 2: System: Sends prescription to patient, patient have 2 choices either to buy himself or send to pharmacy through system

Step 3: Pharmacy:

- Accepts
- Prepares
- Ships

Step 4: Patient: Receives medicine

"The pharmacy module currently shows a mix of patient and pharmacy functionalities, which creates confusion in user experience and system logic. Features such as 'Book Appointment' and 'My Cart' are not relevant to pharmacy users and should be removed.

The pharmacy interface must be redesigned as a fulfillment system where pharmacies receive prescriptions from doctors, process orders, and manage deliveries.

Additionally, the system is currently exposing backend error messages (e.g., DioException 404/403), which is unacceptable for end users and must be replaced with user-friendly error handling.

The dashboard should focus on incoming prescriptions, order status (pending, processing, completed), and inventory management. Each order should include patient details, prescribed medicines, and actionable steps such as accept, dispatch, and complete.

This module is a critical part of the virtual hospital ecosystem and must reflect a clear, role-specific workflow rather than a generic dashboard."

We need A **connected healthcare ecosystem**

Areas lefts .

1. Secure login , to detect robots or fake traffic, finger print or face scanner security feature or login option. Terms and conditions agree on sign up process.
2. Easy login by Facebook or google. Or phone. Number
3. Email verification of users by clicking on link afterwards

4. Two factor account verification and sign in for security, it should be enabled in settings, people should have the options to change phone number email address, mailing addressed
5. User/ patient should be signed in after signing in. password save and remember me options for easy login
6. Webpage should look like a website with added features as mentioned above.
7. App UX is not aligned with phone screen.
8. Many functionalities are not tested yet due to errors in flow, fix these then we will be able to comment.
9. Make at least 10 users of each category and run their functionality. For examples, 10 doctors on boarded, 5 are specialists in different category, 5 are general, 10 pharmacies across Pakistan, 10 labs across Pakistan. 10 courses for doctor, 10 course/plans for patients, 10 patients from different regions of Pakistan. Then we will test functionality across different modules. They should interact as we explained earlier, complete integration of system from onboarding to payment, QA and analytics.
10. Please show admin, super admin and security related features. we need a demo on these portals to see what is included in these panels.
11. APPLICATION SHOULD WORK STAND ALONE AS DISCUSSED
12. ,Voice API, Language change ,Gamification and life style module is completely left presently.
